

Why do we need ETL - Use case 1

Your organization is starting to have more questions about historical trends and patterns in your data.

Without ETL

With ETL

Theory

- ➔ Currently, the org only has a database the product, and running these heavy analytical queries runs the risk breaking the transactional database for the product.
- ➔ Thus, you decide to replicate the data on an database designed specifically for analytics to power these heavy queries while not risking the production transactions database.
- ➔ You build an ETL pipeline to replicate data from the transactional database to the analytical database, including some data transformations to make it easier to use.
