

Why do we need ETL - Use case 2

- You have a lot of different data points

Why do companies have data in different places? How many places?

- Overview of data flow in any company

++ if your vendors have different systems - you will get the data in different systems

- eg, Coke sell colddrink to bigbazar,Dmart,Walmart
 - Dmart mantain its data in MySQL database.
 - Walmart mantain its data in Posrges DB
 - Big bazar mantain its data in MariaDB
 - Small retailers maintain their data in excel files

++

Everyone might be saving data in different format

- Dmart might be saving the data in one format (eg, 12\$, eg, Sahil)
- Bigbazar might be saving the data in one format (eg, 12\$, eg, Sahil
- Walmart might be saving the data in one format (eg, 2\$, eg, Sahil)

- You as pepsi want data from everyone right?
 - You will need to collect data from different places and combine it together and while combining you will need to apply transformations
 - This is ETL
