

How to choose ETL Tool?

Tools themselves

- The pricing model should be affordable.
 - Based on your current load + 50% more "load" (just 1.5x the data sources & data volume to get an estimate)
- Self-hosting option is available
 - To get off the ground quickly before switching to a managed service.
- Onboarding time for a new ETL Developer should be 1-2 days max.
- Testing & versioning should be available for the extract & load pipelines.
- The tool should be able to run its pipelines against different environments
 - Dev
 - UAT
 - Prod
- The tool should be GDPR-compliant (EU).
- The tool should be deployable into your company's secured internal network.
- The tools need to be able to modify data to remove/mask/... personally identifiable information (PII) securely.

Tool Environment

- The tool should have a good network,
 - Forums, Consultants, implementation partners etc
 - The tool should have a strong community (e.g., on Slack, Forums, Reddit/Stackoverflow).
- The tool should have robust documentation.
 - Guides
 - examples of implementations on the internet
 - APIs
- The tool should have decent general support getting feedback within an hour.

Connectors

- A broad connector library (100+).
- Ability to source data from your production database.
- Ability to target your analytics **data warehouse**.
- Ability to target common **data lakes** (AWS S3,...)
- Ability to build a connector yourself with some **SDK**.
- Connector library needs to continue to grow. (1-2 new connectors should be added each month)
- Ability to upgrade to paid support to fix connector bugs faster than one week.
