

History of Databases

➡ In 1970, Dr. Codd published a research paper about **relational data models**.

- The relational data model allowed us to normalise the data and store it in multiple tables.

➡ In 1973, two IBM employees, "Donald Chamberlin" and "Raymond Boyce" used this paper and started creating a standard language called **SQL** to interact with these relational data models.

- SQL allowed us to store data in an elegant way (rows and columns)

➡ In 1979, Oracle created an RDBMS (we can call RDBMS a database) based on SQL

Once a thing is created which has capability of making money, every company will jump into it to make money

➡ In 1985, IBM created an RDBMS based on SQL called DB2.

➡ In 1986, Professor at UC Berkley started working on Postgres

➡ In 1987, Microsoft created RDBMS based on SQL called SQL Server (based on different flavour of SQL called TSQL)

- ➡ In 1995, Company named MySQL AB created RDBMS based on SQL called MySQL, which is the **World's most popular open-source database**.
- ➡ In 1996, Postgres was renamed PostgreSQL, which is **world's most advanced open-source database**.
- ➡ In 2008, Sun Microsystems bought MySQL for \$1 billion.
- ➡ In 2010, Oracle acquired Sun Microsystems for \$7 billion (hence MySQL became the product of Oracle)
- ➡ In 2012, Michael left Sun Microsystems and developed a fork of MySQL called MariaDB, largely out of concern about the future of MySQL
